

**Table 1. Recommendations Summary**

<b>Primary Care</b>
<ul style="list-style-type: none"><li>• We <b>recommend</b> that management of opioid use disorder be performed in primary care* as part of the continuum of care for patients with opioid use disorder (strong recommendation, moderate quality evidence).</li></ul>
<b>Diagnosis</b>
<ul style="list-style-type: none"><li>• Clinicians <b>could consider</b> the use of a simple tool such as the Prescription Opioid Misuse Index (POMI) if assistance is needed identifying chronic pain patients who may have opioid use disorder (weak recommendation, very low quality evidence).</li></ul>
<b>Pharmacotherapy</b>
<ul style="list-style-type: none"><li>• We <b>recommend</b> clinicians discuss use of buprenorphine-naloxone or methadone with their patients for treatment of opioid use disorder (strong recommendation, moderate quality evidence).<ul style="list-style-type: none"><li>○ Methadone may be superior for retention in treatment. However, buprenorphine-naloxone may be easier to implement in practice due to fewer prescribing restrictions and considerations.</li></ul></li><li>• Clinicians <b>could consider</b> naltrexone for patients who have been opioid free for at least 7-10 days and who are unable or unwilling to use Opioid Agonist Therapy (weak recommendation, low quality evidence).</li><li>• We <b>recommend against</b> the use of cannabinoids for management of opioid use disorder (strong recommendation, very low quality evidence).</li></ul>
<b>Prescribing Practices</b>
<ul style="list-style-type: none"><li>• Clinicians <b>could consider</b> take-home doses (i.e. 2 to 7 days) as an option when need and stability indicate (weak recommendation, very low quality evidence).</li><li>• Clinicians <b>could consider</b> urine drug testing as part of the management of patients with opioid use disorder (weak recommendation, no RCT evidence).</li><li>• Clinicians <b>could consider</b> treatment agreements (i.e. contracts) in the management of opioid use disorder for some patients (weak recommendation, no RCT evidence).</li><li>• We <b>recommend against</b> punitive measures involving opioid agonist treatment (i.e. reduction in dose or loss of carries), unless safety is a concern (strong recommendation, moderate quality evidence).</li></ul>
<b>Tapering</b>
<ul style="list-style-type: none"><li>• We <b>recommend against</b> initiation of opioid agonist treatment with the intention to discontinue in the short-term. Opioid agonist treatment is intended as long-term management. Optimal duration is unknown and may be indefinite (strong recommendation, low quality evidence)</li></ul>
<b>Psychosocial</b>
<ul style="list-style-type: none"><li>• We <b>recommend</b> the addition of counselling to pharmacotherapy in patients with opioid use disorder where available (strong recommendation, low quality evidence).</li></ul>
<b>Residential Treatment</b>
<ul style="list-style-type: none"><li>• There is <b>insufficient evidence</b> to create a recommendation for or against the use of residential treatment for patients with opioid use disorder (no recommendation, no RCT evidence).</li></ul>
<b>Comorbidities</b>
<ul style="list-style-type: none"><li>• There is <b>insufficient evidence</b> to create specific recommendations for the following co-morbidities in patients with opioid use disorder: chronic pain, acute pain, insomnia, anxiety, ADHD (no recommendation, insufficient evidence).</li></ul>

\*In RCTs, primary care may have included team-based care, support/training available, affiliation with substance misuse clinic, or 24-hour pager support. Training and supports will vary per practitioner, practice site and population served.
